

CONTRIBUTION TO THE ADB RESULTS FRAMEWORK

Level 2 Results Framework Indicators (Output and Outcome)	Targets	Methods/Comments
Greenhouse gas emission reduction	14,821,396 million tCO ₂ e to be avoided by 2019 (per year)	Carbon dioxide reduction was calculated based on the effective treatment of 890 tons of fluorocarbon (HCFC-23), and onsite energy savings of 387,426 tons of coal equivalent. The calculation method is aligned with the draft ADB guidelines for estimating investment in climate change mitigation and GHG emission reduction in ADB projects. ¹

ADB = Asian Development Bank, GHG = greenhouse gas, tCO₂e = tons of carbon dioxide equivalent.
